

Removal & Install Guidelines.

When removing or installing cabinets it is best to work in pairs, especially when lifting or securing heavy objects.

Removal Guidelines

- Empty all cabinets.
- Turn off power & water supply to kitchen.
- Remove appliances.
- Set up temporary kitchen (if required).
- Remove all doors, shelves & accessory items.
- Remove countertops (maybe attached by screw, glue or by other methods).
- Remove all screws attaching base cabinets to the walls & to each other, before removing cabinets.
- Detach one wall cabinet at a time from the wall & any adjoining cabinet, before removing.

Prior to assembly & install carry out any wall repairs that may be required. Find the highest point on the floor (where the cabinets are being installed) & draw a horizontal line along the wall 34 ¾" above this point. This line represents the height of the base cabinets. Repeat this process at 53 5/8" for the bottom of the wall cabinets & again at the required height (see elevations & plans) for the top of the wall cabinets. Mark on the wall the locations of the studs & if required draw the cabinet outlines on the walls. N.B. you may want to attach a strip of wood along the 53 5/8" line to aid with the install process (to be removed on completion) or build a "T-bar" at this height. See height & installation chart below.

Assembly/Install Tool Checklist

- Drill/Cordless screwdriver & bits
- Hammer
- Tape measure
- Pencil
- Clamps
- Stud sensor
- Level
- Shim packs
- Saw/chisel
- Step ladder
- Euro-Rite installation screw kit

Using the individual cabinet instructions begin assembling cabinets. Generally it is best to put all doors & drawer fronts to one side until cabinet install is complete.

Installation Guidelines

- Begin with any corner wall cabinet.
- Place the cabinet at the required height using t-bar & co-worker as support.
- Secure level cabinet to wall through the top mounting rails & wall studs, using shims to ensure the cabinet is vertical. Once vertical & level secure to wall via bottom mounting rail.
- Work your way out from the corner wall cabinet using the same basic process. -Secure each new cabinet to the attached ones with clamps before “joining” with 1 1/8” screws.
- Consult your plans for filler location & cut to size. Attach filler to cabinet before install.
- Once wall cabinets are in place begin base cabinet install (again corner 1st). You may find that more patience is required to level base cabinets using shims etc.
- NOTE a Base Corner Cabinet is not directly attached to the wall, but is secured to the cabinets on either side.
- Again work out from the corner using clamps to secure the unattached cabinet to the installed ones, before leveling & installing.
- Once this process is complete install doors & drawers as per instructions.
